

IntelliMagic

Availability Intelligence

End-to-End Storage Infrastructure Analytics

Most solutions are either really strong on VMware support, fabric support, or storage support. IntelliMagic Vision is different. IntelliMagic Vision collects performance and configuration information on the VMware, fabric and storage systems to provide a complete and end-to-end picture. On top of that, IntelliMagic provides integrated topology visualization and automatically correlates and embeds the configuration relationships in the user interface. This offers you a wide range of use cases, presented in the following table.

	PERFORMANCE	CAPACITY	CONFIGURATION
VMware I/O	End-to-End Performance Analysis	I/O Workload Trending	End-to-End Path Analysis
SAN Fabric	Performance Bottleneck and Error Detection	Port Usage Trending	Zoning Misconfiguration Detection*
SAN Storage	Automated Performance & Capacity Analysis	Capacity Forecasting and Trending	Configuration Variance Detection

► What This Means for You

For the first time there is a solution where you can identify a VM that is struggling, automatically drill down to the datastores, see the related LUNs, and visualize the LUN performance in just a couple of mouse clicks. You can also visualize the entire infrastructure from the VMware guest through the ESX Host, to the connected fabric ports, see the related switch ports for the storage system and see the associated LUNs in a single view. This allows you to:

- Quickly identify root cause of storage performance issues,
- Identify zoning irregularities,
- Uncover hidden bottlenecks in seconds as opposed to hours,
- And much more, see table above.
